4. CLASS DIAGRAM

- A search functionality should allow users to quickly locate tasks, schedules, and personnel information.
- Notifications should be implemented in a way that makes them aware of the pending approvals, task rejections, and schedule updates in real-time, with a delay of no less than 2-3 seconds, both in the website and email form.

Reliability: System stability is crucial to avoid problematic timings in the website's performance. This means if the server fails, the only way to retrieve information is through the admin page.

- There should be a specific Admin role to ensure the proper history of changes and flow of work.
- The system should handle concurrent requests efficiently to prevent delays in critical operations, such as TA duty approvals or proctoring assignments. The system should handle at least 500 users at the same time, which is realistic given the staff size of the Engineering Faculty.

Database Usability: The database should be structured to provide easy access to important information without unnecessary complexity for all its users. This means optimizing the algorithms for proctor assignment, task sorting and information retrieval most efficiently. Maintaining the database in such a way that the repetition of data is avoided should provide that. A more compact database will increase the desired performance.

- Role-based access should be implemented to ensure that each user can only view or edit relevant data, maintaining security while promoting efficiency.

Constraints or Pseudo Requirements:

Mobility of Implementation: Each department operates differently in terms of handling TA responsibilities, proctoring assignments, and workflow approvals. The system must be flexible enough to accommodate these variations without requiring extensive reconfiguration.

- Some departments may require automated proctoring assignment mechanisms, while others rely on manual selections by department staff or instructors.
- The system should allow departments to the most efficient way they prefer
-

Security: Given the sensitivity of academic records and personnel data, there needs to be clear definitions of the information each role can see on their screens.

- All user actions, such as task approvals, rejections, and leave request modifications, should be logged to maintain accountability.
- Basic data encryption should be applied both at rest and in transit to safeguard user information against unauthorized access.
